EARLY-STAGE · OPEN SOURCE · BNB CHAIN

Tavorix Token Check

Plain-language risk checks for BNB Chain tokens, with the reasons shown.

tavorix.xyz · github.com/tavorix/tavorix · pre-MVP, not validated

Raw warning flags without context create false alarms

Scam signals

Honeypots, hidden taxes, thin or unlocked liquidity, a few wallets holding almost everything.

Centralization

Who can mint, pause, blacklist or upgrade a token. Legitimate issuer-controlled assets often score high here.

Alert fatigue

When everything is flagged, people stop reading warnings. Mixing the two kinds of risk teaches users to ignore them.

Two separate scores, each with its reasons

Scam-risk score

35 MEDIUM

One wallet holds 73.2% of supply, and liquidity is unlocked.

Centralization score

45 HIGH

The owner is a single wallet and the contract can mint new tokens.

Real output from the demo (October 2026). Design challenge: telling an issuer wallet from an ordinary large holder.

Same name, very different risk

Official USDT

5

LOW scam risk

Centralization 45 HIGH: one issuer wallet controls the contract and can mint.

Fake USDT (a copy)

80

HIGH scam risk

Flagged as impersonating USDT. One wallet holds 56.9%. Centralization 0 LOW.

Real output from the demo (October 2026). Official: 0x55d3…7955. Copy: 0xC8B2…9F9B (a publicly reported fake; do not interact).

How it works

1 Paste an address

A BNB Chain token contract address, taken from a trusted source.

2 We read public data

BNB Chain RPC, DexScreener and GoPlus. Third-party data can be wrong or missing.

3 You get a report

Two scores, reasons, evidence coverage, a check matrix and a JSON report. Checks with no data are never counted as safe.

Where Tavorix fits among existing scanners

What exists

Scanners such as GoPlus, Token Sniffer and Honeypot.is flag many scam patterns. Tavorix builds on GoPlus data.

The gap we target

Scam and issuer-control signals are often blended, and missing data is easy to miss.

What Tavorix adds

Two separate scores with reasons, evidence coverage, and a public dataset and accuracy report (planned).

Why it matters for BNB Chain

Built for BNB Chain

Every check reads BNB Smart Chain data through BNB Chain RPC, DexScreener and GoPlus.

Protects newer traders

Plain-language reasons help people who cannot read contracts or on-chain data.

Open for builders

MIT-licensed code. Wallets and dApps can reuse it, and an open API is planned.

How Tavorix can earn (planned)

Free and open source

The core scanner and basic report stay free under the MIT license.

API for wallets

Paid usage tiers so a swap can check a token first. Planned, not yet built.

Premium for traders

Alerts, watchlists and deeper reports. Planned, not yet built.

Where we are, honestly

Working scanner (18 checks, two separate scores)	**Done**
Open-source code and 42 automated tests	**Done**
Publicly hosted demo (tavorix.xyz/check)	**Done**
Labeled dataset (34 scored tokens)	**In progress**
Independent validation	**Planned**
Team page	**Coming soon**

Latest evaluation (34 tokens) published with all failures: it caught 3 of 10 old rugpulls and falsely flagged 6 of 24 healthy tokens. No accuracy claims. Scores are estimates, not financial advice.

Roadmap, each step checkable

Now

Public demo (live), documentation, a frozen held-out test list, and more active scam examples.

Check: live demo and dataset in the repository.

Next

Improve old-rugpull detection (7 of 10 missed), then re-measure on new rows and publish all results.

Check: published method and results.

Later (no date)

Simulation-based honeypot detection, an open API, and a pilot with traders.

Check: API docs and pilot summary.

Proposed, no fixed dates.

Next steps and the team

Team

Dadang Setiawan, Founder
github.com/ddng-dev

Open roles: security engineer, data or ML engineer.

Next steps

More active scam examples and a frozen test list, then a new evaluation including failures.

Any token plans come only after validation, independent audits and legal review. No token has been issued and no token sale is open.
